

ABSTRACT

[0067] A master file may be created and stored on a client computing device. Changes to the master file may be made locally at the client computing device. The master file may be selected for replication using an associated replication property. Changes to the master file may be replicated to a connected computing device such as a server. Changes to a replica of the master file may be made at the connected computing device. If they do not conflict with local changes the to master file, changes to the replica may be replicated back to the master file.
